The universe is a really big place and here is a very **badly placed image**

of *our **milky** way*

*thanks

ok now here is a much more better placed beautiful picture of a mathematical penis:

$$\frac{b + -\sqrt{b^2 - 4(ac)}}{2ab} \quad (1)$$

Figure 1: the quartratic formula

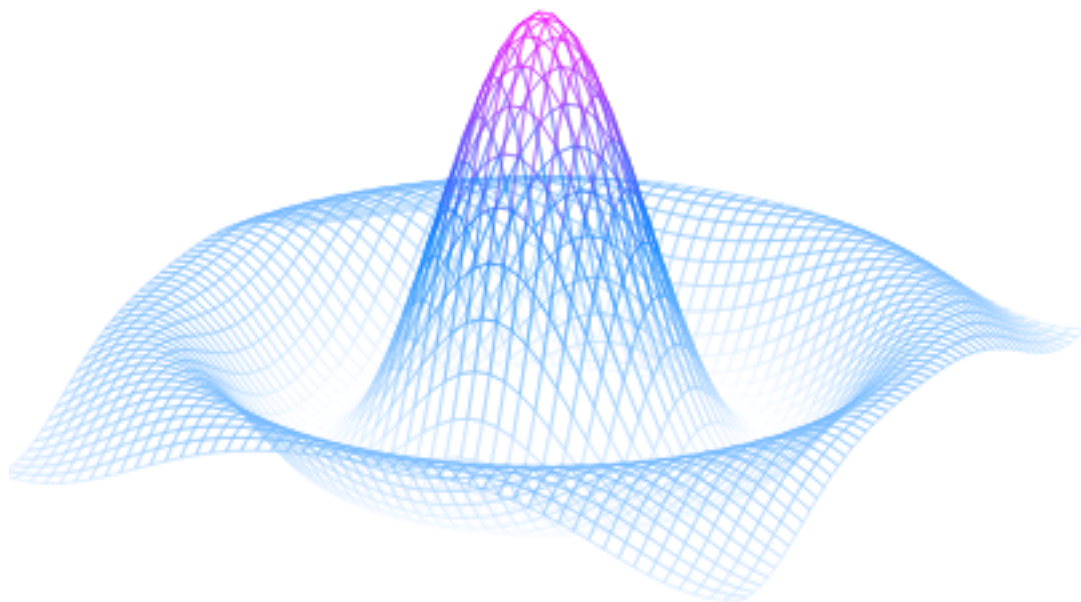

Figure 2: A mathematical penis

okay, so figure 2 is the peen and its on page 3, but figure 1 is the quadratic formula and is on page 3, check if its right!

okay, up next is lists

- this is an item
- and this is another item
- damn this is convenient (this is actually put on after an indent)
- oh it appears that it does not matter
- it will still just be aligned, I mean it should be; its the whole purpose

okay so apparently when you can do the \$ math here \$ in a whole new line! like this: but you can add numbers by just using the standard beginequation thingy like this:

$$E = mc^2 \tag{2}$$

Take that einstein!

wait what if we put the
begin ones in line like

$$E = mc^2 \tag{3}$$

so its like in one line?

yeah okay it does not want to be in one line. also its not
beginequation, its

beginMATH for inline, which is completely unnecessary to write that much
anyways but let me guess the previous equation number is 3 right? and the
first one is 2. Did I get that right too??

yeah dumbass cuz I'm cheating with the
label trick

lets see if there is any difference if I try to use the
(
) instead of the \$ \$ here is the famous $a^2 + b^2 = c^2$
lemme try some integrals

$$\int_{freedom}^{stoiene} \int \frac{dx}{dt} = \text{sum stuff here idk lol} \tag{4}$$
